

High-Performance Lightweight De-Slicking Grit

Safety. Traction. Reliability.

Overview

When winter conditions are at their worst, our Lightweight De-Slicking Grit provides the immediate traction needed to keep pedestrians and vehicles moving safely. Engineered for maximum "bite," this porous, angular grit is designed to stay on top of the ice and snow rather than sinking to the bottom, providing a long-lasting, non-slip surface.

Instant Traction On: Highways, Roadways, Streets, Pathways, Sidewalks, Parking Lots

Performance: High-friction angular edges "lock" into ice for immediate traction and slip resistance.

Extreme Cold Safety: Is very effective at really low temperatures.

Enhanced Melting Power: Dark color absorbs solar energy helping melt surrounding ice.

Better Visibility: Darker color indicates treated areas and provides a safety visual on white snow color roads.

Improved Effectiveness: Combining with salt or ice melt extends the supply and lessens the negative impacts to vehicles, roadways, side walks and parking areas while still maintaining safe driving conditions.

Pro Tip: Mix with road salt to create a dual-action solution—the salt melts the ice while the grit provides the mechanical grip.
